

gold query

```
SELECT ?f WHERE {  
  ?f wdt:P57 wdt:Q25191 . }
```

annotated query

```
SELECT ?f WHERE {  
  ?f wdt:[property:director]  
  wd:[entity:Christopher Nolan] . }
```

P57 ↔ [property:director]

Q25191 ↔ [entity:Christopher Nolan]

The two forms differ only by substitution, so the k-th bracketed label corresponds positionally to the k-th identifier. Walking both in parallel recovers a mention-level ground truth for 547 of 567 rows without any new annotation.
